                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 15, Application US/08974899;
Patent No. 6037454
GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION:
TITLE OF INVENTION:
HUMBER OF SEQUENCES:
CORRESPONDENCE ADDRESS:
ADDRESSEE: Genentech, Inc.
STREET: 1 DNA Way
CITY: South San Francisco
STATE: California
COUNTRY: USA
                  APPLICANT: HASEGAWA, MAMORU
TITLE OF INVENTION: HUMANIZED ANTIBODIES
NUMBER OF SECURCES: 103
CORRESPONDENCE ADDRESS:
ADDRESSE: 103
CORRESPONDENCE ADDRESS:
ADDRESSE: NIXON & VANDERHYE P.C.
STREET: 1100 NORTH GLEBE ROAD
CITY: ARLINGTON
STATE: VIRGINIA
CONTRY: U.S.A.
ZIP: 22201-4714
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.25
CURSENT APPLICATION NUMBER: US/08/483,528B
FILING DATE: 07-JUN-95
CLASSIFICATION NUMBER: 0386
TELEFERM: (703)816-4000
THELEFMX: (703)816-4100
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ZIP: 94080

riofli receptor beta chain V-D-J region (120-1J) - mouse (fragment)
C; Species: Mus musculus (house mouse)
C; Species: Mus musculus (house mouse)
C; Species: Mus musculus (house mouse)
C; Accession: Pr0640; Pr0685; Pr0729
R; Feeney, A.J.
J; Exp. Med. 174, 115-124, 1991
A; Title: Juncilonal sequences of fetal T cell receptor beta chains have few N regions.
A; Recession: Pr0640
A; Status: translation not shown
A; Molecule type: mRNA
A; Residues: 1-5 <FES>
A; Status: translation not shown
A; Molecule type: DNA
A; Residues: 1-5 <FES>
A; Experimental source: newborn thymus, strain BALB/c, clone 120-1J

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RESULT 10

G37196

Bradykinin-potentiating peptide 7 - island jararaca
C;Species: Bothrops insularis (island jararaca)
C;Date: 14-Feb-1992 #sequence_revision 01-Dec-1992 #text_change 05-Aug-1994
C;Accession: G37196
C;Accession: G37196
A;Cintra, A.C.O.; Vieira, 1990
A;Title: Primary structure and biological activity of bradykinin potentiating peptides A;Reference number: A37196; MUID:90351557; PMID:2386615
A;Accession: G37196
A;Accession: G37196
A;Residues: preliminary
A;Molecule type: profein
A;Residues: 1-5 c(IN)
C;Keywords: pyroglutamic acid
F;1/Modified site: pyrrolidone carboxylic acid (Gln) #status experimental
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ig heavy chain CRD3 region (clone 4-91C) - human (fragment)

"Primary structure and biological activity of bradykinin potentiating peptides from Bochrops insularis snake venom.";

J. Protein Chem. 9:221-227(1990)

J. PROTION: THIS PEPTIDE BOTH INHIBITS THE ACTIVITY OF THE ANGIOTENSIN-CONVERTING ENZYME AND ENHANCES THE ACTION OF BRADYKININ BY INHIBITING THE KINASES THAT INACTIVATE IT.

IT ACTS AS AN INDIRECT HYPOTENSIVE AGENT.

INCREASES THE IMPULSE FREQUENCY AND PRODUCES A SPIKE BROADENING OF THE IDENTIFIED HEART EXCITATORY NEURON (PON); ALSO ENHANCES THE AMPLITUDE AND FREQUENCY OF THE HEART BEAT. HAS ALSO AN EFFECT ON SEVERAL OTHER MUSCLES.

PIR; A32480; A32480.

Identification and immunocytochemical localization of proctolin in pericardial organs of the shore crab, Carcinus maenas.";
Pericardial organs of the shore crab, Carcinus maenas.";
-1- FUNCTION: STIMILATES CARDIAC OUTPUT AND HINDGUT MOTILITY,
MODULATES VISCERAL AND SKELETAL MUSCLE IN MANY ARTHROPODS.
-1- TISSUE SPECIFICITY: FOUND IN THE LATERAL WHITE NEURONS AND IN THE CRAB PERICARDIAL ORGANS.

                                                                                                                                                                                                                                                                                                                          ð
                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                           (CDR HI) of the heavy chain of murine anti-CD23 (FCERII) monoclonal antibody C11 (see also ANY32263). The invention provides altered antibodies, such as chimeric or humanised antibodies, which comprise sufficient of the antho acid sequences of C11 light and heavy chain CDRs (see ANY3254-59) to render them capable of binding to the CD23 C type II molecule expressed on haemacopoietic cells. The antibodies are used to block soluble CD23 formation for treatment of arthritis, lupus erythematosus, Hashimoto's thyroiditis, multiple sclerosis, clabetes, uveitis, dermatitis, psoriasis, urticaria, nephrotic gindbetes, uveitis, dermatitis, psoriasis, urticaria, nephrotic syndrome, glomerulonephritis, inflammatory bowel disease, ulcerative colitis, Crohn's disease, Sogren's syndrome, allergies, allergic asthma, intrinsic asthma, acute asthmatic exacerbation, rhinitis, colitis, Crohn's disease, COPD, insulitis, bronchitis (particularly chronic bronchitis) or diabetes (particularly type I diabetes), and B-cell malignancies (claimed). They are also useful for studying interactions between CD23 and various ligands and

New humanised anti-CEA monoclonal antibody - having engrafted murine CDRs, used for diagnosis, imaging and therapy of CEA-producing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New humanised monoclonal antibodies (MAbs) comprising the complementary determining regions (CDRs) of a parental murine class III anti-carcinoembryonic (CEA) MAb engrafted to the framework regions (FRs) of a heterologous antibody which can be derived from any species including human, retain the anti-CEA binding specificity
                                                                                                                                                                                                                                                                                                   Mice were immunised with an extract of human atherosclerotic plaque, then spleen cells were fused with SP2/01-Ag-14 myeloma cells. Hybridomas were screened by ELISA for reactivity with the immunogen and clone 22D3 was isolated. The Z2D3 antibody reacts specifically with atherosclerotic tissue; it recognises a non-protein antigen containing cholesterol (or similar steroid that is a substrate for phosphatidylcholine or related compound that is a substrate for phosphalipase C). The CDR sequences for the heavy and light chains of Z2D3 were determined; peptides comprising the CDRs are claimed,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Monoclonal antibody, humanised, mouse, framework region, FR, CDR, complementary determining region, anti-carcinoembryonic antigen, CEA, diagnosis, imaging, therapy, immune response.
New antigen comprising hydroxy:steroid and quat. ammonium salt and related antibodies, useful e.g. for imaging, ablating or treating atherosclerotic plaque, and detecting plaque specific antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .;

```

```
This sequence represents a heavy chain complementarity determining region (CDR) from a tumour antigen specific antibody. The invention relates to a method for identifying a binding molecule having selective affinity for a ligand comprising: (a) selectively immobilising a diverse population of binding molecules to a solid support, (b) simultaneously contacting the diverse population immobilised on the solid support with 2 or more ligands; and (c) determining at least one binding molecule which selectively binds to one or more of the ligands. The method allows for the rapid and efficient methods for the identification of binding molecules which exhibit selective affinity for one or more ligands of interest. They are used particularly for identifying tumour-specific binding polypeptides which can be used as targeting agents for cancer therapy that minimises impact on non-tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Tumour antigen; antibody; CDR; complementarity determining region;

of the parental murine MAb but are less immunogenic in a human subject than the parental MAb. The humanised antibodies can be used in diagnosis, imaging and therapy of CRA-producing cancers and patients receiving the humanised antibodies and conjugates show improved therapeutic results, decreased immune responses and decreased immune-mediated adverse effects compared to the parent antibody. This sequence is a murine derived CDR region which corresponds to CDR 1 in the heavy chain of the humanised MAb. See
                                                                                                                                                                                                                                                           Gaps

The present sequence is given in a specification relating to an isolated nucleic acid molecule encoding a platelet membrane glycoprotein receptor glycoprotein V (GPVI), also called TANGO 26s. The GPVI polymucleorides and polypeptides and their modulators, e.g. antisense nucleic acids, ribozymes and antibodies, are useful for preventing, treating and disorders associated with aberrant expression or activity of GPVI. These disorders include bleeding disorders
(e.g. thrombocytopaenia), blood vessel injury, thrombotic disorders (e.g. thrombocic occlusion of the coronary arteries), haemorrhagic disorders, coronary artery and cerebral artery diseases (e.g. stroke and isorders, coronary artery and cerebral artery diseases (e.g. stroke and isorders), immunological diseases (e.g. therosclerosis and myocardial infartion), immunological diseases (e.g. platelet disorder) and cardiac isohaemia following angioplasty and metastatic cancers, especially of the colon and liver.
                                                                                                     ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a human or humanised antibody (Ab) which specifically binds to fibroblast activating protein alpha (FAPalpha). The antibodies are useful for preparing a composition for the treatment of cancer, and for imaging tumours associated with activated stromal fibroblasts, such as colorectal cancer, non-small-cell lung cancer, breast cancer, head and neck cancer, non-small-cell lung cancer, cancer, pancreatic cancer and metastatic or brain cancer, and diseases associated with the same, such as inflammation and wound healing. The present sequence is a peptide described in the exemplification of the

This invention relates to a molecule that binds MCP-1 (human monocyte chemoattractant protein-1). The molecule has at least one antigen binding site comprising at least one immunosolbobinin (Ig) heavy and/or light chain variable domain (Wh. VI). The antibody of the invention inhibite binding of MCP-1 (and also eotaxin) to specific receptors, so preventing migration of monocytes and T cells. These are human tribodies with very high affinity for MCP-1, but no significant reaction with other human CC-type chemokines or MCP-1 from other species. The MCP-1 binding molecules, specifically antibodies that cross react with eotaxin, are used to prevent or treat MCP-1 or eotaxin-mediated disorders, particularly those that involve migration or mediated disorders, particularly those that involve migration or activation of monocytes and T cells, e.g. allergies (allergic rhimitis, Miseases (asthma, psoriasis, allergic contact dermatitis), inflammatory diseases (asthma, psoriasis, diseases of bone and cartilage (osteoporosis) autoimmune disease (rheumatoid arthritis disease) (costeoporosis, osteoarthritis, periodontal disease) heematological disorders (haemolytic anaemia, idiopathic thrombocytopaenia) graft rejection, cancers that include leucocyte inflaration, (rejection, cancers that include leucocyte inflaration, (reletiosic) osteoporosis and many other diseases listed in the specification. The present sequence represents the human anti-(MCP) increases of cancers the human anti-(MCP) increases of cancers the human anti-(MCP) increases of cancers the increase the include leucocyte increases of bone and cancers and cancers and many other diseases between the human anti-(MCP) increases of cancers and many other diseases between the human anti-(MCP) increases of cancers and cancers the human anti-(MCP) increases and
New compound that binds human monocyte chemoattractant protein-1, useful e.g. for treating inflammation, comprises immunoglobulin chains with specific hypervariable regions
                                                                                                                                                                                                                                                                                                                                                          Claim 1; Page 35; 42pp; English.

It is optionally humanized and in the form F(ab/2, F(ab)', Fab, Fv, scFv or V-min, and is produced in transgenic animals or plants.

They are used in gene therapy and as vaccines. The antibody and/or chemckine construct is also used for preparing a pharmaceutical composition for treating, preventing and/or alleviating immunological disorders including autoimmune diseases (e.g. multiple sclerosis, type I diabetes and rheumation, atopic dermatitis and psoriasis), inflammatory diseases (e.g. skin inflammation, atopic dermatitis and psoriasis), inflammatory diseases and transplant rejections. The present sequence is murine Mc-1 antibody heavy, chain variable domain (VH) complementarity determining region 1

This sequence represents the complementarity determining region-1 (CDR-1) of the rWI2 heavy Chain. This sequence is used in an antibody of the invention. The antibody of the invention is a chimeric or humanised anti-idiotype antibody of the invention is a chimeric or humanised anti-idiotype antibodies (cAb and hAb, respectively) or a fragment which specifically binds to the idiotype region of an anti-carcinoembryonic antigen (CBA), where: (i) cAb comprises the rWI2 light (L) and heavy (H) chain variable regions, or silent mutations, and (ii) hAb comprises rWI2 complementarity determining regions (CDR) and humanised framework (FR) regions. The hAb is used as a vaccine to stimulate an immune response in a patient against cancers expressing CBA. The hAb, can be used to clear non-targeted antibody in a method of diagnosis or treatment of a patient where a CBA antibody is used as a (pre-)targeting or therapy agent. The cAb is used to detect the presence of an antibody that specifically binds to CBA in a sample.
                                           Chimeric and humanised anti-carcinoembryonic antigen anti-idiotype antibodies - useful in detection of anti-CEA antibodies and as vaccine to stimulate immune response against cancer
                                                                                                                                                                                                                                                                                                                                                          72.7%; Score 24; DB 18; L. 75.0%; Pred.                                                                                                                                                                                                                                                                                                                                      Complementarity determining regions (CDRs) CDR1H, CDR2H and CDR3H (AAR85496-98) and CDR1L, CDR2L and CDR3L (AAR85502-04) are components of the heavy chain variable region and light chain variable region, respectively, of single chain antibody scrv(FWP51) (AAR85495). The CDRs are derived from mouse monoclonal antibody FWP51 (BCACC 90112118) directed to the human growth factor receptor HERS. The scrv is used as the tumour antigen binding domain of a bifunctional protein that is expressed in cytotoxic T-lymphocytes (CTLs), allowing

This invention relates to sialoadhesin factor-1 (SAF-1) monoclonal antibodies 13G3 and 11G4. A neutrophil-priming dose of SAF-1 agonist antibodies 13G3 and 11G4. A neutrophil-priming dose of SAF-1 agonist useful for treating or preventing an infectious disease state such as bacterial infection, viral infections, sepsis, antibiotic resistant bacterial infection, viral infections and those involving intracellular pathogens and parasites such as Listeria monocytogenes, Salmonella and lesibmania in a mammal. Nucleic acid sequences encoding the variable light chain and heavy chain peptide sequences are useful for mutagenic introduction of specific changes within the nucleic acid sequences encoding the (complementarity determining regions) CDRs or framework and for incorporation of the resulting modified or fusion nucleic acid sequence into a plasmid for expression. The CDR-encoding regions comprising silent mutations are used in construction of humanized
This invention describes a novel monoclonal antibody that is directed against a Clostridium difficile toxin and recognises and neutralises an epitope in the ligand domain, translocation domain or catalytic domain of the toxin. Humanised antibodies are desribed which are expressed in plants and can be used for immunotherapy of diseases caused by Clostridium difficile enterctoxin (toxin A) or cytotoxin (toxin B), especially pseudomembranous colitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New sialoadhesin factor-1 agonist antibody having the characteristic of monoclonal antibody 13G3 or 11G4 for treating osteomyelitis, deep seated wound infections and antibiotic resistant bacterial infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sialoadhesin factor-1; SAF-1; anti-SAF-1 monoclonal antibody; 13G3; 11G4; osteomyelitis; wound infection; sepsis; Listeria monocytogene; Salmonella; Leishmania; heavy chain variable region; mouse; complementarity determing region; CDR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Anti-SAF-1 antibody 13G3 H chain V region CDR peptide SEQ ID 3.
                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention provides a method of treating or preventing immunoglobulin-mediated reperfusion or ischemic injury in a subject. The method involves administering an inhibitor of an interaction between a pathogenic immunoglobulin, and a schemic-specific antigen or a component of the complement pathway. The method is useful for treating or preventing immunoglobulin-mediated reperfusion or ischemic injury, in particular, injury that results following a naturally occurring episode, a surgical procedure (e.g. angioplasty, etenting procedure, atherectomy or bypass surgery), or in an injury that occurs in a cardiovascular tissue. The method is also useful for treating or preventing, in a subject, tissue damage following reperfusion caused by a pathogenic immunoglobulin, e.g. pathogenic igms. The present sequence represents the complementarity determining region (CDRI) of a heavy chain variable region of 2285 IgM, a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Treating or preventing immunoglobulin-mediated reperfusion or ischemic injury resulting from e.g. angioplasty or bypass surgery, by administering an inhibitor of pathogenic immunoglobulin and ischemic antigen interaction

This antibody contains in its heavy chain 3 complemetarity determining regions CDR1 (AAR74929-R74931), CDR2 (AAR74932-R794935) and CDR3 (AAR74936-R74939), this is also true of the light chain which has its own CDR1 (AAR74944-R74946 and AAR85774), CDR2 (AAR74947-R74949) and CDR3 (AAR74950-R749540. The antibody and DNA encoding it are useful in pharmacological, medical and blochemical fields.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                        H-CDR-1 of anti-idiotype antibody against human anticancer antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel anti-idiotype antibody against an human anticancer monoclonal antibody - and DNA sequences encoding the antibody, useful in pharmacology, medicine and biochemical fields.

Sequence 23, Application US/08318157B

Patent No. 5874540

GENERAL INFORMATION:
APPLICANT: HANSEN, Hans J.
TITLE OF INVENTION: CDR-GRAFTED TYPE III ANTI-CEA HUMANIZED
TITLE OF INVENTION: MOUSE MONOCLONAL ANTIBODIES
NUMBER OF SEQUENCES: 58
CORRESPONDENCE ADDRESS:
ADDRESSEE: FOLGY & Lardner
STREET: 3000 K Street, N.W., Suite 500
CITY: Washington
STATE: D.C.
COUNTRY: USA
                                                                                                                         Sequence 32, Application US/08480434
Patent No. 5811248
GENERAL INFORMATION:
APPLICANT: Charles C. Ditlow, et al.
TITLE OF INVENTION: ATHEROSCLEROTIC PLAQUE SPECIFIC ANTIGENS,
TITLE OF INVENTION: ANTIBODIES THERETO, AND USES THEREOF
NUMBER OF SEQUENCES: 88
CORRESPONDENCE ADDRESS:
ADDRESSEE: Pennie & Edmonds
STREET: 1155 Avenue of the Americas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            81.8%; Score 27; DB 2; Length 5; 100.0%; Pred. SUBUNIT.
-!- CATALYTIC ACTIVITY: ATP + H(2)O + H(+) (In) = ADP + phosphate + H(+) (Out).
-!- SUBUNIT: P-TYPE ATPASES HAVE 2 COMPONENTS, CF(1) - THE CATALYTIC CORE - AND CF(0) - THE MEMBRANE PROTON CHANNEL. CF(1) HAS FIVE SUBUNITS: ALPHA(3), BETA(3), GAMMA(1), DELTA(1), EPSILON(1). CF(0) HAS THREE MAIN SUBUNITS: A, B AND C.
-!- SUBCELLULAR LOCATION: Mitcochondrial.
-!- SIMILARITY: BELONGS TO THE ATPASE ALPHA/BETA CHAINS FAMILY.
HSC-2DPAGE; P99504; DOG.

Comp. Biochem. Physiol. 117B:445-452(1997).
-1- FUNCTION: CYSTEINE PROTEINASE THAT HYDROLYSES BASIC PROTEINS.
HYDROLYZE BASIC PROTEINS SUCH AS HISTONE, SALMINE AND CLUPAINE BUT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         NOT MILK CASEIN.
